RESEARCH INTERESTS & EXPERTISE

My interest and expertise lie in the algorithmic, applied and topological aspects of non-relational data such as graphs and their higher-order counterpart: hypergraphs. In recent years, I have worked on various aspects of graph representation learning, e.g. adversarial robustness, applications to physics-based simulations and Knowledge graph-augmented LLMs.

- **Graph representation learning:** (1) Designed physics-driven Graph Neural Networks to exploit low-resolution simulation data to efficiently and effectively predict flow field on high-resolution mesh originating from complex aerodynamical systems. (2) Improved robustness of Graph Neural Networks under adversarial attack. (3) Proposed algorithms to measure and reduce uncertainty associated with real-valued properties on uncertain graphs.
- **Higher-order data representations and Topological Data Analysis:** Designed algorithms for (1) finding core nodes in hypergraphs, (2) generating and estimating properties of random hypergraphs with a prescribed constraint (3) visualising hypergraphs, (4) subsampling nodes to approximate and accelerate computation of topological features.

I have published in reputable data mining and ML venues such as ICML, VLDB, ECML-PKDD, DEXA and journals such as SEC (IF=10). I also have a patent filed at the UK IP office.
